

Forensic AI — Second PC Setup Guide

Run the current Forensic AI project on another Windows PC.

1. Requirements

Requirement	Required?
Windows PC	Yes
Python 3.11 / 3.12	Yes
VS Code	Optional
Git / Java / Maven	No
MySQL	No for current SQLite setup
Internet	Yes for pip install
requirements.txt	Yes
forensic_ai_dev.db	Yes if existing data is needed
uploads folder	Yes for existing images/results
.venv	No — create a new one

2. ZIP contents

Keep:

```
ForensicAI/  
■■■ app/  
■■■ uploads/  
■■■ forensic_ai_dev.db  
■■■ requirements.txt  
■■■ .env  
■■■ .env.example  
■■■ .gitignore  
■■■ README.md
```

Do not copy .venv. Create it again on the second PC.

3. Setup commands

```
cd C:\ForensicAI  
  
python --version  
  
python -m venv .venv  
  
.\.venv\Scripts\Activate.ps1  
  
pip install -r requirements.txt  
  
uvicorn app.main:app --reload
```

4. Open the application

```
http://127.0.0.1:8000
```

5. End-to-end test

1. Open Dashboard.
2. New Claim → enter claimant/policy details.
3. Upload a JPG image and submit.
4. Open the claim → Analyze Claim.
5. Check ELA, Noise/PRNU, JPEG DCT and Timestamp Overlay.
6. Check overall score, risk, evidence and fairness result.
7. Submit Human Review and confirm it is saved.

6. Data storage

Current local setup uses SQLite fallback when MySQL is unavailable.

```
C:\ForensicAI\forensic_ai_dev.db
```

Uploaded images and generated forensic artifacts are stored under the uploads folder. Claim data, image metadata/hash/path, forensic results, reviews and audit information are stored in the database.

7. Important

- Do not delete forensic_ai_dev.db if existing demo data is needed.
- Do not delete uploads if existing images/results are needed.
- If the DB is locked, stop Uvicorn/Python before copying/compressing it.
- MySQL is not required for the current local demo.

Quick command sequence

```
cd C:\ForensicAI
python -m venv .venv
.\.venv\Scripts\Activate.ps1
pip install -r requirements.txt
uvicorn app.main:app --reload
```
